

// The Env file defines the database connection parameters for the DB\_HOST, DB\_NAME, DB\_USER AND DB\_PASSWORD). You should set up those four parameters correctly by getting them from your database you created in your Mysql through php admin. An example of the look of my .env file for my database called cezeife\_Company with user name and password as cezeife\_Company is given below in the third paragraph.

```
define('DB_HOST', 'localhost');  
define('DB_NAME', '');  
define('DB_USER', '');  
define('DB_PASSWORD', '');
```

// For Example,

```
DB_HOST = localhost  
DB_USER = cezeife_Company  
DB_NAME = cezeife_Company  
DB_PASSWORD = cezeife_Company
```
